k. Description of Request: The licensee requests a temporary variance of its minimum flow requirements in the East Fork of the Russian River and the maximum irrigation releases to the Potter Valley Irrigation District (PVID). Due to ongoing drought conditions and operating restrictions, the storage in Lake Pillsbury is severely depleted and is expected to reach critical levels by late fall, whereby bank sloughing in the vicinity of the outlet works and impaired flow releases could occur. In order to conserve water and ensure project operability, the licensee is proposing to reclassify the water year type to reduce flow releases to Eel River below Scott Dam from the current normal water year requirement of 60 cfs to a critical water year flow floor set by the minimum opening of the low-level outlet of approximately 35 cubic feet per second (cfs); flow releases to the East Fork of the Russian River from normal water year requirements of 75 cfs to between 5 and 25 cfs based on storage projections; and flow releases to the PVID from 50 cfs to a demand-based schedule not to exceed 50 cfs. The licensee additionally requests that compliance with flow requirements to the East Fork of the Russian River be measured as a target flow with no buffer versus a minimum flow with a buffer. The licensee would operate the project to maintain at least 30,000 acre-feet of storage in Lake Pillsbury to limit the depletion of the cold-water pool for salmonid protection. The May 16, 2022 filing includes provisions for regular water monitoring and consultation throughout implementation of the proposed variance. The licensee requests that the drought-related variance conclude when Lake Pillsbury storage exceeds 36,000 acre-feet following October 1, 2022 or is superseded by another variance.
